PROJECT BASED LEARNING IN JAVA

(20CST-319/20ITT-319)

TOPIC OF PRESENTATION:

Difference between method overloading and method

overriding.

DISCOVER. LEARN. EMPOWE

Lecture Objectives

In this lecture, we will discuss:

Difference between method overloading and method overriding.

Gunnersity Method Overriding

If subclass (child class) has the same method as declared in the parent class, it is known as **met**l overriding in Java.

- Method with the same name, arguments and return type in both the parent and the child class
- If an overridden method is called from subclass object, it will always refer to the version defi by the subclass
- Need to Override—If a sub class needs have a different method implementation from that of a super class

Usage of Java Method Overriding

- Method overriding is used to provide the specific implementation of a metho which is already provided by its superclass.
- Method overriding is used for runtime polymorphism

Rules for Java Method Overriding

- The method must have the same name as in the parent class
- The method must have the same parameter as in the parent class.
- There must be an IS-A relationship (inheritance).

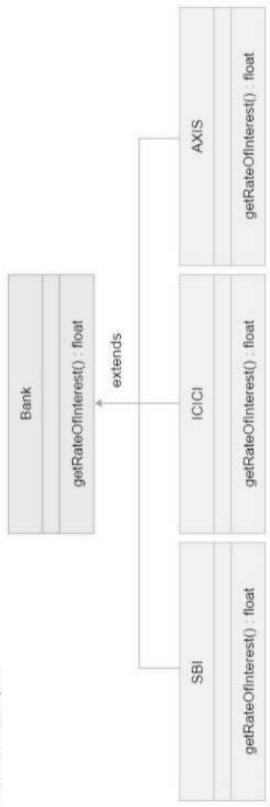

guinnessir Method Overriding

```
Draw() and erase() ir
                                                                                                                                                                                                                                                                                                                                                                                                                                           Draw() and e
                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Derived Clas
                                                                                                                                           Class
                                                                                                                                                                                                                                                                                                                                                                                                                                                            System.out.println("erasing Square");
                                                                                                                                                                                                                                                                                                                                                                 System.out.println("Drawing Square");
                                                                                                                                                                                      System.out.println("erasing Shape");
                                                                                         System.out.println("Drawing Shape");
                                                                                                                                                                                                                                                                         class Square extends Shape
                                                                                                                                                                                                                                                                                                                                                                                                                void erase()
                                                                                                                                                                                                                                                                                                                   void draw()
public class Shape {
                                                                                                                                         void erase()
                                              void draw()
```

Method Overriding

Another Example:

Can we override static method?

No, a static method cannot be overridden. It can be proved by runtime polymorphism.

Why can we not override static method?

It is because the static method is bound with class whereas instance method is bound with an object. Static belongs to the class area, and an instance belongs to the heap area.

Can we override java main method?

No, because the main is a static method,

Dynamic Method Dispatch or Runtime Polymorphism

CHANDIGARH UNIVERSITY Basis of one of Java's most powerful concepts: dynamic method

Dynamic method dispatch occurs when the Java language resolves

a call at runtime

•Runtime polymorphism is possible in java using

superclass reference variables

overridden methods

Method Overloading

Method Overloading in Java

- If a class has multiple methods having same name but different in parameters, it is known as Method Overloa
- If we have to perform only one operation, having same name of the methods increases the readability of the program.

Allows to define the method with the same name but either return type or arguments list should be different

```
Class BasicCalculator {
Void sum(int a,int b) {
System.out.println(a+b);
}

void sum(int a,int b,int c) {
System.out.println(a+b+c);
}
```

Advantage of method overloading

Method overloading increases the readability of the program.

Different ways to overload the method

There are two ways to overload the method in java

- By changing number of arguments
- By changing the data type

Q) Why Method Overloading is not possible by changing the return type of method only?

In java, method overloading is not possible by changing the return type of the method only because ambiguity. Let's see how ambiguity may occur:

```
class Adder {
static int add(int a,int b) {return a+b;}
static double add(int a,int b) {return a+b;}
}
class TestOverloading3 {
public static void main(String[] args) {
System.out.println(Adder.add(11,11));//ambiguity
}}
}
```

Output:

Compile Time Error: method add(int,int) is already defined in class Adder

System.out.println(Adder.add(11,11)); //Here, how can java determine which sum() method should

No.	Method Overloading	Method Overriding
3	Method overloading is used to increase the readability of the program.	Method overriding is used to provide the specific implementation of the method that is already provided by its super class.
2)	Method overloading is performed within class.	Method overriding occurs in two classes that have IS-A (inheritance) relationship.
3)	In case of method overloading, parameter must be different.	In case of method overriding, parameter must be same.
(4)	Method overloading is the example of compile time polymorphism.	Method overriding is the example of run time polymorphism.
2)	In java, method overloading can't be performed by changing return type of the method only. Return type can be same or different in method overloading. But you must have to change the parameter.	Return type must be same or covariant in method overriding.

QUIZ:

- What is the process of defining two or more methods within same class that have same name but different parameters declaration?
- a) method overloading
- b) method overriding
- c) method hiding
- d) none of the mentioned
- What is the process of defining a method in terms of itself, that is a method that calls itself? 7
- a) Polymorphism
- b) Abstraction
- c) Encapsulation
- d) Recursion

Summary:

In this session, you were able to:

Learn about Difference between method overloading and method overriding.
